

Vehicle Mileage and Reservation Tracker

Portfolio overview | Excel/VBA operational workflow

Independently designed and built end to end by Charles Monsanto, from requirements and control design through implementation, testing, privacy sanitization, and release documentation.

PURPOSE

A practical desktop application that brings mileage entry, vehicle reservations, maintenance status, corrections, and recurring reporting into one governed workflow.

PROBLEM

Separate logs, calendars, and messages make it harder to prevent conflicts, preserve dated status, correct records safely, and keep management views consistent.

SOLUTION AND CONTROLS

The dashboard validates transactions before table writes, blocks invalid reservations, supports grouped corrections, and refreshes the affected reports after approved actions.

EXECUTIVE VALUE

Reviewers can see product ownership, process analysis, internal-control thinking, application engineering, reporting design, and disciplined release preparation in one finished artifact.

Synthetic dashboard showing controlled entry, maintenance, correction, and reporting workflows.

Executive evidence

The application is usable, reviewable, and documented. It combines controlled transactions, traceable corrections, dated maintenance history, and recurring management views without requiring a server, add-in, or external data connection.

Weekly reservations and dated availability

CAPABILITIES

- Mileage entry with odometer validation and recalculation.
- Single- and multi-day reservations, with multiple non-overlapping same-day bookings.
- Dated maintenance history blocks affected reservations and remains visible after return.
- Weekly schedules, monthly mileage, trip counts, scheduled hours, fiscal-year totals, and status.

LIGHTWEIGHT BY DESIGN

Structured Excel tables hold local data; thin worksheet events dispatch actions to standard VBA modules. The complete plain-text source is available for review, with no server, external database, API, add-in, or data connection.

Testing, privacy, and evidence boundaries

Regression checks cover startup, save/edit/delete, recalculation, boundary conflicts, grouped corrections, maintenance, reports, package integrity, and Excel state restoration. Test-machine measures: functional open 1.844 s; dashboard refresh 0.219 s. All records are synthetic; no organization data or external connections are included. No measured business time or cost savings are claimed.

Monthly mileage history and maintenance status

WORKFLOW CONTROLS

- Required-field, date, time, vehicle, driver, and odometer checks before table changes.
- Half-open (start, end) logic allows adjacent bookings and blocks actual overlaps.
- Recent-entry actions keep multi-day reservations grouped and recalculate affected outputs.
- Generated sheets are protected while approved dashboard actions remain available.
